

## Format of files:

There are 5 testcases.

Each testcase folder contains the following:

- A transaction dataset `testn.dat`
- A sample output named `out_m.dat_sorted` where  $m$  is the support (in %-age). The file contains itemsets from `testn.dat` such that they have at least  $m\%$  support.
- This output is sorted by ascii code (as explained in the problem statement).
